Thi Nhu Y Ho

Data Science & Linguistics

yhotn2003@gmail.com |GitHub | LinkedIn

EDUCATION

University of California, Berkeley **Dec 2025**

B.A. Data Science

B.A. Linguistics

Coursework: Econometrics, Data Structures, Statistical Modeling, Machine Learning, Natural Language Processing, Data Engineering, Probability & Statistics

TECHNICAL SKILLS

- Tools: Excel, Power BI, Tableau, PowerPoint, Git, VS Code
- Programming Languages: Python, SQL
- Databases: PostgreSQL, Supabase, DuckDB
- Analysis & Modeling: Data cleaning, regression, survival analysis, machine learning (scikit-learn), geospatial analysis (GeoPandas), dashboards
- Languages: Vietnamese (fluent), Chinese (intermediate)

PROJECTS

Language Access and City Service in Los Angeles (GitHub)

Stacks: Python, SQL, DuckDB, GeoPandas, Survival Analysis, Power BI

- Found that neighborhoods with many limited-English households get the same 311 service as everyone else: requests closed just as fast, and residents reported problems more often, not less. Analyzed 4.1M requests across 1,091 neighborhoods.
- Showed the real slowdown is the type of request, not the neighborhood. Encampment requests take a median of 45–58 days and streetlights 131–218 days in every kind of neighborhood, so I recommended the city focus there instead of on language-access fixes.
- Avoided a false finding: city-staff self-reports (12% of requests) made limited-English areas look slower, so I removed them. Delivered a Power BI dashboard and five recommendations, including 10 neighborhoods to check in person.

San Francisco Airbnb Prices Analysis

Stacks: Python, Scikit-learn, GitHub

- Showed that a standard random train/test split overstated model accuracy by 0.15 R^2 (0.91 vs 0.76), because the same hosts appeared in both sets. I rebuilt the evaluation with a host-level split so the score reflects real use.
- Cleaned 31,278 raw rows down to 7,026 real listings. I traced 98% of the missing prices to listings carried over from earlier scrapes and removed 48 placeholder prices of up to $50,000 a night.
- Built a gradient boosting model that predicts price with R^2 0.78 on unseen hosts. It is typically off by 19% (about $29), against 45% for guessing the median price. Property size and type explain most of the price.

EXPERIENCES

Mt. San Antonio College, Walnut — Teaching Assistant **2022 - 2023**

- Co-instructed with the professor, providing one-on-one and small-group support to 20+ students during lectures
- Hosted weekly office hours and created supplementary practice materials aligned with class content and exams
- Provided feedback and guidance to students working on final projects

Hey Tutor, Los Angeles — Tutor **2023 - 2024**

- Tutored small groups of 2-3 elementary students in math and English in-person, roughly 20 hours/week, reinforcing classroom concepts and assisting with homework
- Created supplementary practice materials tailored to what each group was currently learning in class
- Worked as a teaching assistant alongside the lead teacher for a class of 20+ students during a summer session
